The land chosen for this experiment was an open clay loam, which had previously been used for garden purposes and had been highly manured. The previous season it had born a crop of onions. The land was carefully measured off 100x90 feet, and was divided into two equal parts by a north and south line, running parallel with the rows of onions. The cast half was plowed eight inches deep, and the other half was simply thoroughly pulverized on the surface with a disk harrow, and the whole piece was smoothed with a smoothing harrow and a smoothing board. The whole piece was then divided into five plots running east and west, each plot being twenty by ninety feet. These plots were manured with different fertilizers, or left without manure, as thought best. Thus each differently fertilized plot was half of plowed soil, and half of soil merely harrowed. The questions presented were--First--What will be the comparative yield in growing onions on soil which has been plowed and thoroughly loosened to a depth of eight inches...
